PRESS RELEASE

Oldenburg, Düsseldorf, Hamburg, 20 February 2015

Energy yield 2014: Germany's first offshore windfarm “alpha ventus” continues to operate according to plan after four years of operation

During the operating years from 2011 to 2014, alpha ventus achieved 16,582 full capacity hours and generated 994.9 gigawatt-hours (GWh) of electricity. The yield is therefore 248.73 GWh per year on average and exceeds the generation forecasts by around seven per cent.

In the 2014 operating year, the yield was slightly below average at 235.6 GWh of climate-friendly energy, but still exceeded the forecast by 1.5 per cent. This relatively slightly lower output is attributable to the replacement of some components during the course of the year. The months of January and December 2014 were particularly high yielding with over 30 GWh of generated electricity in each month.

If the power generated during the commissioning period is added to the four full operating years, alpha ventus has generated over 1.2 terawatt-hours of electricity since 2009.

Follow-up projects in Germany

With the inclusion of the first follow-up projects to alpha ventus, EWE, E.ON and Vattenfall are currently realising and operating offshore-windfarms with a total output of 744 megawatts in the German Bight.

EWE: The “Riffgat” offshore-windfarm in the vicinity of Borkum was completely erected by July 2013, and has been feeding environmentally-friendly power into the German grid since February 2014. The 30 wind turbines have a total generation capacity of 108 megawatts.

E.ON: The "Amrumbank West" offshore-windfarm lies to the north of Helgoland in the German Bight, and will achieve a total output of 288 megawatts from its 80 wind turbines. The substation and the first 60 foundations were installed in 2014. Installation of the wind turbines follows in 2015.

Vattenfall: The "DanTysk" offshore-windfarm lying to the west of Sylt was completely installed in 2014 and is already delivering electricity. The 80 wind turbines with a total generation capacity of 288 megawatts have been successively commissioned since December 2014, and are all scheduled to be connected up to the grid by early 2015. Work on the "Sandbank" offshore-windfarm lying approx. 35 kilometres to the west begins in summer 2015: it will have 72 4-megawatt wind turbines and a total output capacity of 288 MW.

alpha ventus

alpha ventus is the first German offshore-windfarm to be constructed on the high seas, and is located some 45 kilometres off the coast of Borkum. EWE, E.ON and Vattenfall established the "Deutsche Offshore-Testfeld und Infrastruktur GmbH & Co. KG" (DOTI) in order to build and operate the alpha ventus windfarm. The research and development results from alpha ventus are incorporated into the design, construction and operation of follow-up offshore projects.

The alpha ventus pilot windfarm comprises twelve 5-megawatt wind turbines: 6 AREVA Wind M5000 turbines, and six REpower 5M turbines (as of 20.1.2014: Senvion SE).
